

Agentic AI for Tech Professionals

Governance & Responsible AI

Why Governance Matters in Enterprise AI

Enterprise AI systems must be secure, traceable, and controlled

- AI systems handle sensitive data
- Incorrect decisions create business risk
- Governance improves trust and reliability
- Human oversight remains important
- Compliance is required in enterprises

Why Governance Matters in Enterprise AI (2)

Enterprise AI is not just about automation.

It must also be:

- ✓ secure
- ✓ controlled
- ✓ traceable
- ✓ compliant

Why Governance Matters in Enterprise AI (3)

Example:

An AI workflow may process:

- operational incidents
- employee information
- manufacturing logs

Without governance:

- ✗ security risk
- ✗ compliance risk
- ✗ operational risk

Governance makes AI safe for enterprise use.

Data Security in AI Workflows

AI workflows must protect sensitive operational and business data

- Secure API credentials
- Limit access to sensitive data
- Encrypt stored information
- Avoid exposing confidential logs
- Apply least-privilege access

Data Security in AI Workflows (2)

AI systems often connect to:

- databases
- APIs
- ERP systems
- operational logs

This means security is critical.

Examples:

- never hardcode API keys
- restrict workflow permissions
- protect audit logs
- secure database access

Enterprise AI workflows must follow:

👉 security-first design

Human-in-the-Loop (HITL)

Humans remain part of critical AI decision workflows

- AI should not fully automate critical actions
- Humans review high-risk decisions
- Approval steps improve reliability
- Reduces operational mistakes
- Builds enterprise trust in AI

Human-in-the-Loop (HITL) (2)

One important enterprise principle:

AI should assist humans,
not completely replace them.

Example:

If AI marks an incident:

👉 “Critical Production Failure”

Human-in-the-Loop (HITL) (3)

The workflow may:

- pause
- request supervisor approval
- continue only after confirmation

This is called:

👉 Human-in-the-Loop (HITL)

Very important for:

- safety
- compliance
- operational control

Audit Logging & Traceability

Enterprise AI systems must record decisions and workflow activity

- Track AI decisions
- Store workflow execution history
- Record approvals and actions
- Support troubleshooting
- Enable compliance audits

Audit Logging & Traceability (2)

Enterprises need visibility into:

- what AI decided
- when workflow executed
- who approved actions
- which system was affected

Audit logging enables:

- ✓ accountability
- ✓ troubleshooting
- ✓ governance
- ✓ compliance reporting

Audit Logging & Traceability (3)

Example:

Store:

- incident
- AI classification
- workflow status
- approval decision
- timestamps

This creates:

👉 traceable enterprise AI systems.

Compliance & Responsible AI

AI systems must align with organizational and regulatory requirements

- Follow internal governance policies
- Protect personal and operational data
- Ensure explainable AI decisions
- Maintain workflow transparency
- Support enterprise compliance standards

Compliance & Responsible AI (2)

Responsible AI means:

AI systems must operate safely and transparently.

Examples:

- explain why incidents were classified
- store workflow records
- protect confidential data
- ensure approvals exist for critical actions

ENTERPRISE AI GOVERNANCE & COMPLIANCE ARCHITECTURE

Secure. Governed. Compliant.
