Workflow Design Patterns

Workflow Thinking for Enterprise AI

Enterprise AI systems are built as connected workflow patterns

- Workflows break systems into stages
- Each stage has one responsibility
- Decisions control routing paths
- Automation reduces manual handling
- Patterns improve scalability

Workflow Thinking for Enterprise AI (2)

Enterprise AI systems are not:

 one giant AI prompt

They are:

 structured workflows

Each step handles:

- one task
- one responsibility
- one decision

Workflow Thinking for Enterprise AI (3)

Example:

Input

- AI classification
- IF routing
- storage
- notification

This makes systems:

- maintainable
- scalable
- reliable

Conditional Routing (IF Logic)

Workflow decisions control where data should go

- IF nodes create routing logic
- Different categories trigger different actions
- Enables specialized workflows
- Reduces unnecessary processing
- Core enterprise automation pattern

Conditional Routing (IF Logic) (2)

IF nodes are the “decision points” of workflows.

Example:

If:

Category = Equipment

👉 Maintenance workflow

If:

Category = IT

👉 IT workflow

This is exactly what orchestrators did yesterday in Python.

Now:

👉 visual enterprise orchestration

Error Handling & Retry Patterns

Enterprise workflows must handle failures gracefully

- APIs can fail
- AI responses may be invalid
- Retries improve reliability
- Logging helps troubleshooting
- Error branches prevent workflow crashes

WORKFLOW WITH SUCCESS & ERROR HANDLING

Reliable automation with retry, logging, and recovery

Error Handling & Retry Patterns (2)

Real systems fail.

Examples:

- API timeout
- invalid JSON
- database unavailable
- AI output malformed

Error Handling & Retry Patterns (3)

Enterprise workflows must:

- ✓ retry
- ✓ log errors
- ✓ continue safely

This separates:

✗ demo workflows

from

✓ production systems

Enterprise Incident Workflow Pattern

AI workflows combine analysis, routing, storage, and notification

- Receive incident ticket
- AI analyzes incident
- IF node routes workflow
- Store results in DB/Sheets
- Notify responsible team

Enterprise Incident Workflow Pattern (2)

This is now a complete enterprise pattern.

Input:

“Cooling system failure”

Workflow:

1. AI classifies
2. IF node routes
3. Store incident
4. Notify maintenance

This is:

👉 operational AI automation

Exactly how enterprise workflows are designed.
